

KYBELLA® is an FDA-approved, non-surgical treatment that specifically targets localized fat under the chin. Many times, excess fat beneath the chin develops as a result of aging or heredity, making it difficult to remedy with diet and exercise.

BENEFITS

- Non-surgical double chin treatment
- Natural and very safe
- Short recovery period, with mild swelling under the chin

HOW IT WORKS

KYBELLA® is a patented formulation of deoxycholic acid manufactured by Allergan, the maker of BOTOX®. Deoxycholic acid is a naturally occurring substance in our bodies used to digest fat in our diets. KYBELLA® destroys the fat cell membrane, allowing the fat to be expelled out of the body.

WHAT TO EXPECT

Once the area is mapped and chilled, you will experience multiple quick injections to the treatment area. You may experience some swelling, numbness, bruising, and/or tingling in the treatment area. Your treatment time will be less than 50 minutes.

RESULTS

Results vary from person to person, and multiple sessions are recommended (if the fatty deposit is larger) to gradually reduce the unwanted fat. As the body expels the fat, slimming of the area occurs over the next 8 weeks. An added benefit is tightening of the overlying skin in most cases.

RECOMMENDED SESSIONS

- 2 - 5 sessions
- Repeat chin injections every 6-8 weeks with KYBELLA®

POSSIBLE DOWNTIME

- Swelling, possible bruising, and itching
- Possible tingling, pins and needles sensation, or pain
- Possible temporary nodules under the skin

POST-TREATMENT CARE

- Resume normal activities immediately post-treatment
- Avoid any strenuous exercise immediately post-treatment
